Jeff,

I took a walk down the sankaty beach today and as you probably know, one of the geo tubes is almost fully exposed on the ocean facing side. This was expected from this type of storm. The critical question at this point is when will sbpf and the Town cover the tube in order to provide adequate nourishment and mitigation. This critical question must be addressed immediately as part of the existing emergency permit and not the notice of intent. Also I noticed that plastic tarp had been used in the construction (see photos. the first is the exposed tube from the northern end. the second two are the plastic.) note that the material in the the second two photos is not geo textile fabric. It is clear plastic tarp/sheet.

Obviously this was not part of the emergency permit and not part of the current notice of intent. I can't quite tell how much is there because only some of it is exposed although it is throughout the linear extent of the project site. Unfortunately it also seems that some of it has already washed out to sea. It appears that this is a violation and another enforcement order will have to be issued. I will not be able to go to the meeting tonight so please have the town address these questions and concerns and also submit this email to the current notice of intent file. Thank you very much.

Best

Cormac
